Education

Brunel University London

London, UK

BEng (Hons) Computer Systems Engineering, with Industrial Placement

Sep 2023 – 2027 (expected)

- **Year 1 (2023–24): A+ (First Class)** **Year 2 (2024–25): A+ (First Class)**
- Topper (1st of 30), Course Representative, Member of IET and DSS Brunel

Experience

BMW Group

Logistics Planning Intern (Controls & Automation)

Jul 2025 – Sep 2026

- Doubled KPI coverage from 13 to **27** by building an Oracle APEX logistics dashboard (SQL-driven, with automated feeds from several source systems), presented to **60+** colleagues and senior management.
- Raised master-data quality from **52% to 61%** in one month by building an Excel validation workbook that flagged mismatches across two systems and assigned owners for each fix.
- Projected a **15%** throughput gain on a semi-automated forklift system by configuring devices, diagnosing communication faults and writing deployment and recovery procedures.
- Supported Industry 4.0 projects by writing PLC ladder logic and supplier technical specifications for automated material-flow systems.
- **Technologies:** Oracle APEX, SQL, PL/SQL, SAP, Excel/VBA, Chart.js, Plotly.js, Siemens TIA Portal V17, WAGO e!COCKPIT

EY (Ernst & Young)

Data Analyst

Jul 2024 – Sep 2024

- Enhanced decision accuracy by analysing **20,000+** data entries in SAP Analytics Cloud.
- Reduced planning time with SAC predictive modelling for data-driven forecasts, and cut data interpretation time by creating **5 interactive dashboards**.
- Optimised key business metrics by designing and implementing custom calculations.
- **Technologies:** SAP Analytics Cloud (SAC), Microsoft Excel, Microsoft Office

Cloud Nebula Enterprises

Web Developer

Jun 2024 – Sep 2024

- Boosted financial decision-making efficiency by developing a web-based data analysis tool that handles **60,000+** entries.
- Reduced data interpretation time by **25%** by implementing interactive visualisations.
- Translated business requirements into technical solutions by working closely with 3+ domain experts.
- **Technologies:** Python, Pandas, Dash, NumPy, HTML/CSS, Machine Learning Basics, Finance Basics (Stocks, Options, Commodity)

Projects

Final-Year Project | AI route optimisation, BMW Hams Hall

Sep 2026 – Apr 2027

- Developing an AI model to sequence plant delivery (taxi) routes dynamically, aiming to cut loading time and raise pallets per trip.
- Will pilot it against the current route, tracking loading time, pallets per trip, route time and driver utilisation.

Pegboard (Production) | Next.js 16, TypeScript, Tailwind 4, Supabase, Clerk, Resend, Vercel

Sep 2026 – Present

- Launched a family chore and pocket-money app where parents post priced jobs, children claim them with photo evidence, and parents sign off from one queue; installable as a PWA with a PIN kiosk mode for shared tablets.
- Protected children's data by design: username-only sign-in, location data stripped from photos, and full data export or deletion.

StreamFlow | TypeScript, React, Rust, Radix | GitHub

Jul 2025

- Won **1st place** at Radix Hack with a decentralised creator-tipping platform on the Radix blockchain that sends viewer tips directly to streamers.
- Added real-time tip analytics and on-chain transaction processing in a TypeScript, React and Rust architecture.

- LuffaBot AI Assistant** | *Python, LangGraph, LangChain, FastAPI* | [GitHub](#) Jul 2025
- Won **1st place** at Brunel University Hack in under 24 hours with a LangGraph multi-tool agent on the Luffa messaging platform that runs group votes and generates images from chat.
 - Reduced wrong tool calls by writing prompt rules that require exact user text and a clarifying question instead of assumed arguments.
- Weather Monitoring System** | *Raspberry Pi Pico, BME280, Python, REST API* May 2025
- Achieved **95%** sensor accuracy in a real-time monitoring system built on a Raspberry Pi Pico with a BME280 sensor.
 - Served readings through REST APIs that support concurrent requests.
- Hack the Wallet** | *Next.js, Starknet, Gemini 1.5 Flash* | [GitHub](#) Apr 2025
- Won **1st place** at the Encode AI London Hackathon (main track plus two sponsor bounties) with a Starknet game where players persuade an AI to return locked crypto, using Gemini 1.5 Flash trust scoring, voice input/output and on-chain rewards on Sepolia.
 - Connected Argent X and Braavos wallets to smart contracts that mint a 100-token airdrop and handle betting and payouts, in a retro pixel-art interface.
- Go Fish** | *Next.js, TypeScript, Solidity, Polkadot* | [GitHub](#) Apr 2025
- Reached the finals of the EasyA x Polkadot Hackathon London with a payment platform for fishing import/export where exporters receive **97.5%** of trade value instantly, using smart contracts and stablecoin integration.
 - Modelled the token flow: importer collateral unlocks trade documents, exporters hold for a 2% bonus or sell to investors, and importers earn a 0.5% rebate on completion.
- Foodo-Baggins** | *Next.js, TypeScript, MongoDB, Ollama* | [GitHub](#) Feb 2025
- Placed **3rd** at Royal Hackaway v8 with an AI nutrition tracker that analyses meal photos and gives calorie estimates and personalised advice.
 - Converted meals into sustainability “Green Points” and added a sarcastic roast of each food choice.
- Banking & Supermarket Management Suite** | *Java, Swing, UML* Oct – Dec 2024
- Built a Java banking application (inheritance, polymorphism, file persistence, role-based screens) and a supermarket system whose checkout debits the customer’s bank account.
 - Designed both with UML use case, class and sequence diagrams, and tested every use case with recorded evidence.
- HyperMint** | *React.js, Next.js, Node.js, Stellar SDK* Oct 2024
- Contributed as frontend developer to a meme-coin creation and trading platform on the Stellar blockchain at the EasyA x Stellar Hackathon.
 - Designed a user-friendly interface for token creation and trading.
- Employee Attendance Management System** | *Python, Flask, MySQL, SQLAlchemy* Aug – Sep 2024
- Cut record-keeping errors by **95%** and leave processing time by **80%** with a Flask and MySQL attendance system.
 - Implemented OTP authentication and automated leave management using Flask-Login, Flask-Mail and Werkzeug.
- Automated Object Retriever** | *Arduino, Ultrasonic Sensor, Embedded C* Jan – Mar 2024
- Reached **95%** item-retrieval accuracy and cut manual retrieval time by **70%** by leading development and testing of an autonomous robot.
 - Built hardware and software together from scratch, programming an Arduino with ultrasonic sensing in embedded C.

Achievements

Hackathons: 1st Brunel University Hack (Jul 2025) | 1st Radix Hack (Jul 2025) | 1st Encode AI London Hackathon (Apr 2025) | Finalist, EasyA x Polkadot Hackathon London (Apr 2025) | 3rd Royal Hackaway v8 (Feb 2025)

Technical Skills

Languages: Python, TypeScript, JavaScript, Java, C, C++, SQL, MATLAB, VBA, Assembly, Verilog HDL

Web & Backend: Next.js, React.js, Node.js, Flask, FastAPI, REST APIs, SQLAlchemy, MySQL, MongoDB, Oracle APEX

AI & Data: LangGraph, LangChain, Gemini API, Ollama, Pandas, NumPy, Dash, SAP Analytics Cloud, Predictive Modelling

Blockchain: Starknet, Polkadot, Radix, Stellar SDK, Solidity

Tools: Git, SAP, Excel/VBA, NetBeans, UML
